The P-965 processor is packed with useful performance features and equipped to play back the highest-quality audio and video sources available today. Digital-to-analog conversion is handled by 24-bit/192kHz DACs, and two-channel PCM sources are remastered to 24-bit/192kHz for improved resolution. The Sherwood has three component-video inputs, switched by relays for wide-bandwidth capability, and upconverts composite and S-video to component video. Overall, a fine value with excellent sound quality for film and good sound quality for two-channel music. *REVIEWED BY GA, ISSUE 56*

SHERWOOD A-965

\$1499

sherwoodamerica.com

The A-965 amplifier is a formidable piece of equipment—a seven-channel amplifier with 100 watts output for each channel into eight ohms, all channels driven simultaneously. The amp uses two toroidal power transformers to supply its seven monoblock amplifiers, and each channel has its own circuit board, which minimizes crosstalk between channels. Dynamic range is excellent and tonal balance is good. *REVIEWED BY GA, ISSUE 56*
